

■ Namma Yatri Ride Analytics – Insight Summary Report

Dataset Overview:

Analyzed over 10,000+ ride records from the Namma Yatri dataset across 5 Indian cities using Python (Pandas, Matplotlib, Seaborn) and Looker Studio for data visualization. The objective was to uncover ride patterns, cancellation trends, fare behavior, and driver performance insights to improve ride operations.

Key Findings:

- ■ Bengaluru accounts for approximately 35% of all rides — the highest among all cities.
- ■ Chennai shows the highest cancellation rate (~14%) compared to other cities.
- ■ Kochi rides have the highest average fare (■260 per ride), likely due to longer routes or surge pricing.
- ■ Drivers with ratings above 4.5 earn nearly 20% higher average fares.
- ■ Ride bookings peak between 6 PM – 9 PM, especially during weekends.
- ■■ Average fare per km varies significantly across cities, indicating local pricing differences.

Tools Used:

- Python (Pandas, Matplotlib, Seaborn)
- Google Colab for data exploration
- Looker Studio for interactive dashboard and visualization

Conclusion:

The analysis revealed valuable operational insights for ride-sharing optimization — including identifying high-demand areas, improving driver performance metrics, and understanding fare trends. These insights can help companies like Namma Yatri enhance user satisfaction and optimize dynamic pricing strategies.
